Mirror Grouping — Key Formulas

Paste-friendly reference sheet. All formulas are written in plain text that works well in Microsoft Word and Google Docs.

Name	Formula (Word-friendly)
Boundary indicator	$\delta(i) = 1$ if $s_i = s_{i-1}$ $\delta(i) = 0$ otherwise for $i = 2, \ldots, n$
Group-start indices	$\text{Starts}(S) = \{1\} \cup \{ i \in [2, n] : s_i = s_{i-1} \}$
Nesting depth D(w)	$D(w) = 0$ if $m \leq 1$ or $w_1 \neq w_{\square}$ $D(w) = 1 + D(w_2 \ldots w_{\square-1})$ if $w_1 = w_{\square}$
MG-RDS	$d_1 = n_1 / L$ $d_{\leq 3} = n_{\leq 3} / L$ $\text{MG-RDS}(W) = \alpha \cdot d_1 + (1 - \alpha) \cdot d_{\leq 3}$ (default $\alpha = 0.7$) n_1 = number of length-1 Mirror Groups in W $n_{\leq 3}$ = number of Mirror Groups of length ≤ 3
Long-LC Flag	Long-LC(W) = True if there exists a Mirror Group g in W such that: length(g) ≥ τ and AT(g) ≥ β (default $\tau = 25$ bp, $\beta = 0.70$)
Two-signal pair	(MG-RDS(W) , Long-LC(W))

Quick Interpretation Matrix

Signal Combination	Interpretation
Low MG-RDS + False flag	Preferable (clean)
High MG-RDS + False flag	Fragmented repetition risk
Low MG-RDS + True flag	Long low-complexity risk
High MG-RDS + True flag	Highest structural concern

Tip: In Microsoft Word, select any formula → Insert → Equation (or press Alt + =) to convert it into a native equation object.
